Pandemic Summary

GoF Virus + Bad Vax = Death + Dollars

DO

Is it possible that a gain-of-function virus followed by a bad vaccine could lead to death and Big Pharma profits?

Yes, it is possible that a gain-of-function virus followed by a bad vaccine could result in increased profits for the pharmaceutical industry, especially if the vaccine is the only available option for controlling the virus. However, it's important to note that such a scenario would not necessarily be the result of intentional actions by the pharmaceutical industry.

The development and production of vaccines can be an expensive and complex process, and the pharmaceutical industry invests significant resources into research and development, clinical trials, and manufacturing. When a new virus emerges, the pressure to develop a vaccine is high, and there may be limited time and resources available for ensuring that the vaccine is safe and effective. In such cases, a bad vaccine may still be approved and widely used, even if it is not the best option available.

It's important to have regulatory systems in place that prioritize public health over corporate profits, and to ensure that vaccines are developed, tested, and manufactured in a transparent and responsible manner. This can help to minimize the risk of harm to public health and reduce the potential for exploitation of public health crises for commercial gain.
